

IntelliJ Set up

Contents

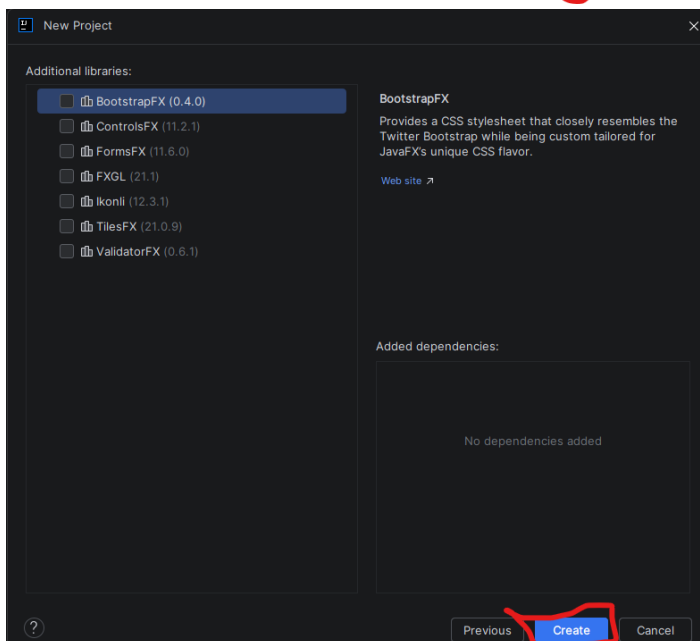

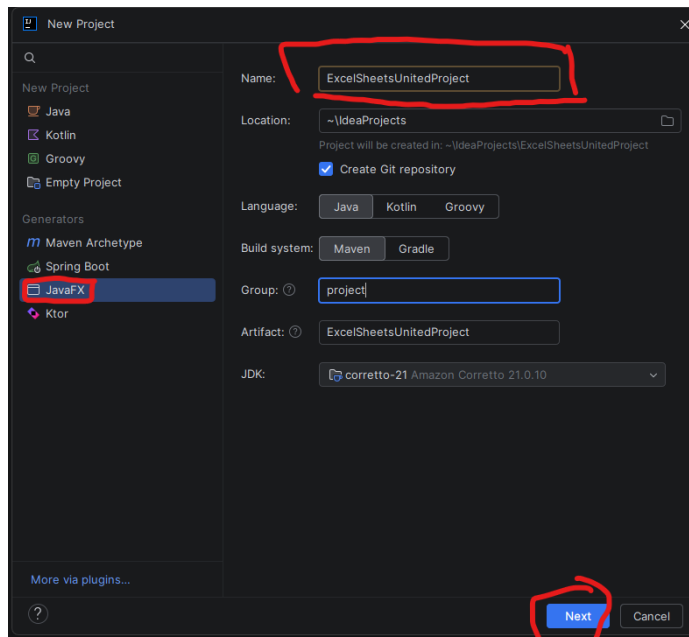

Step 1:	2
Step 2:	3
Step 3:	4
Step 4:	5
Notes for when pushing and pulling branches:	6

Step 1:

Create a New Project, select JavaFX (under generators), Language: Java and Build system: Maven.

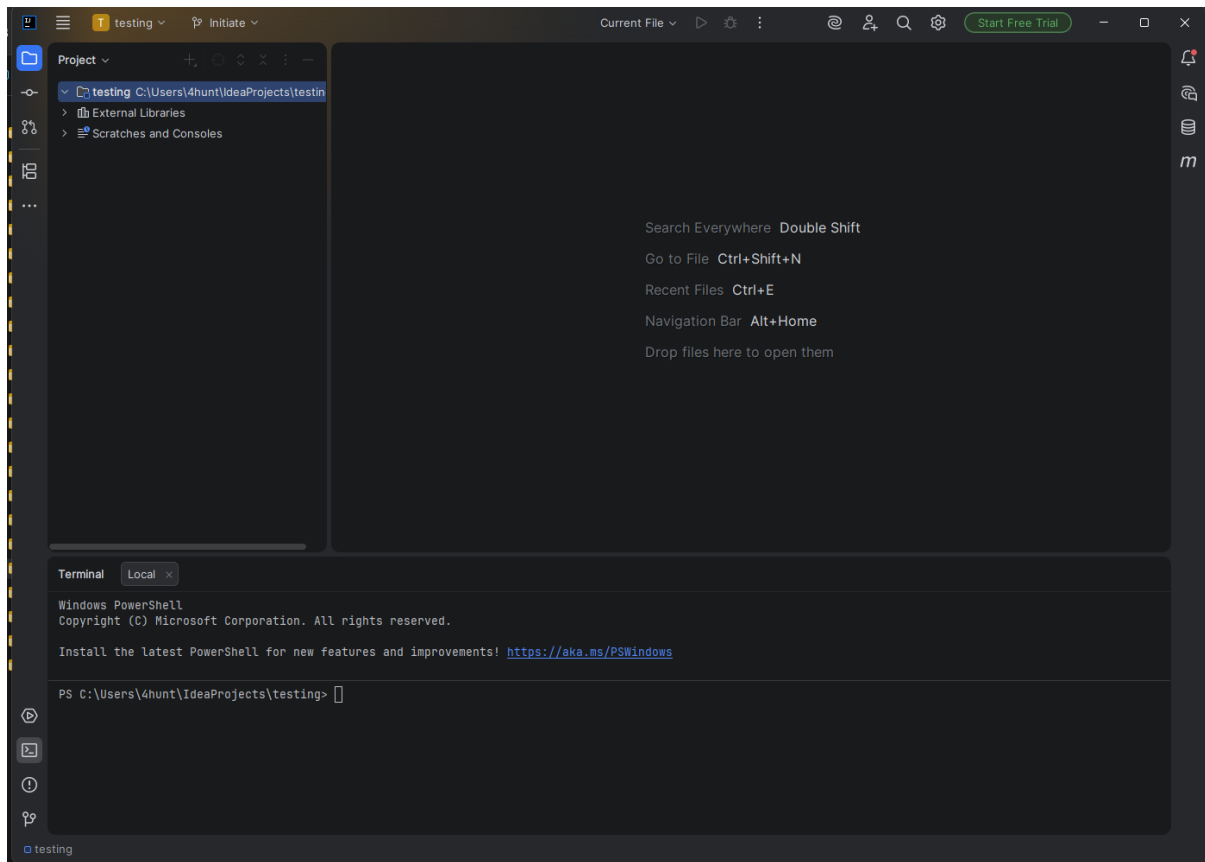

Important notes:

- Make sure there is not a pre-existing project file for what ever you want to name it.
- Check create Git repository.

Step 2:

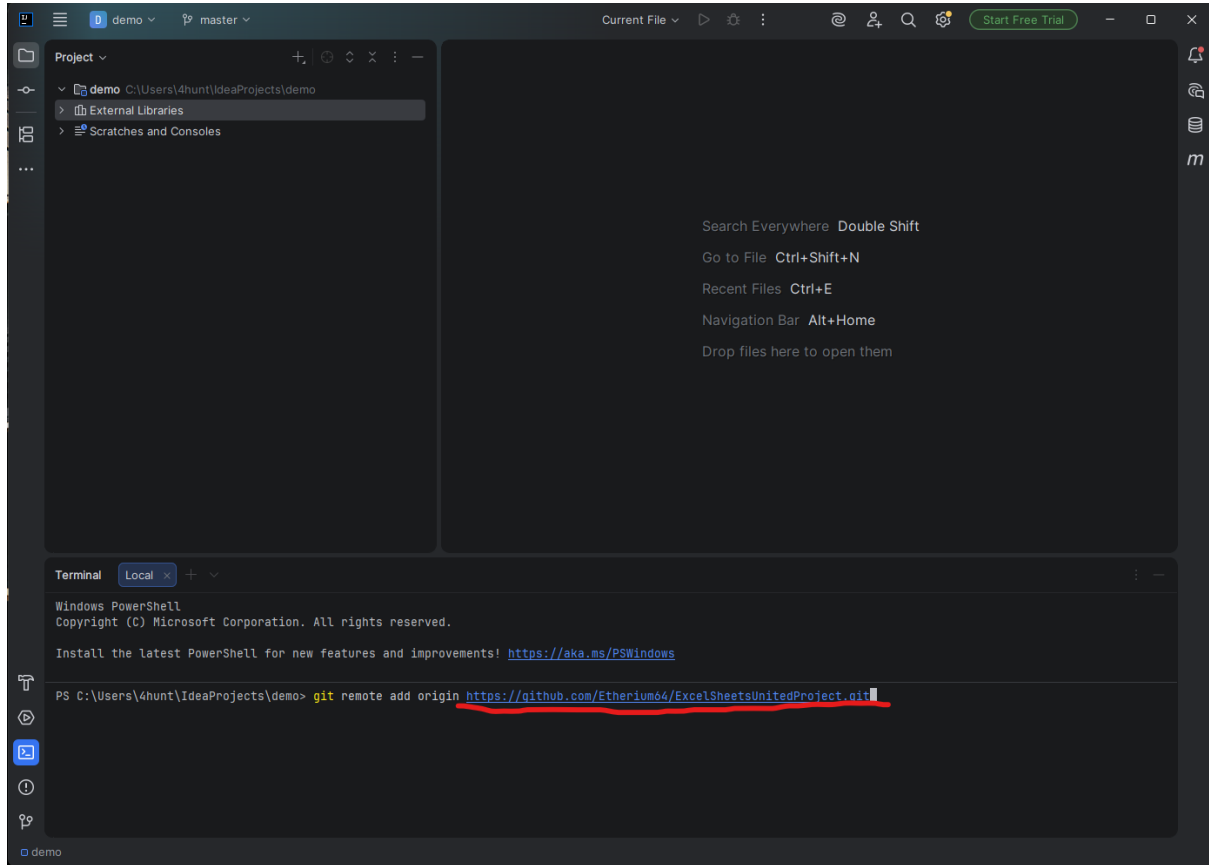

Delete All the default created files in the project workspace. You should only have the project folder (empty), the External libraries and the scratches and consoles

Step 3:

Connect your local project to the git repository with:

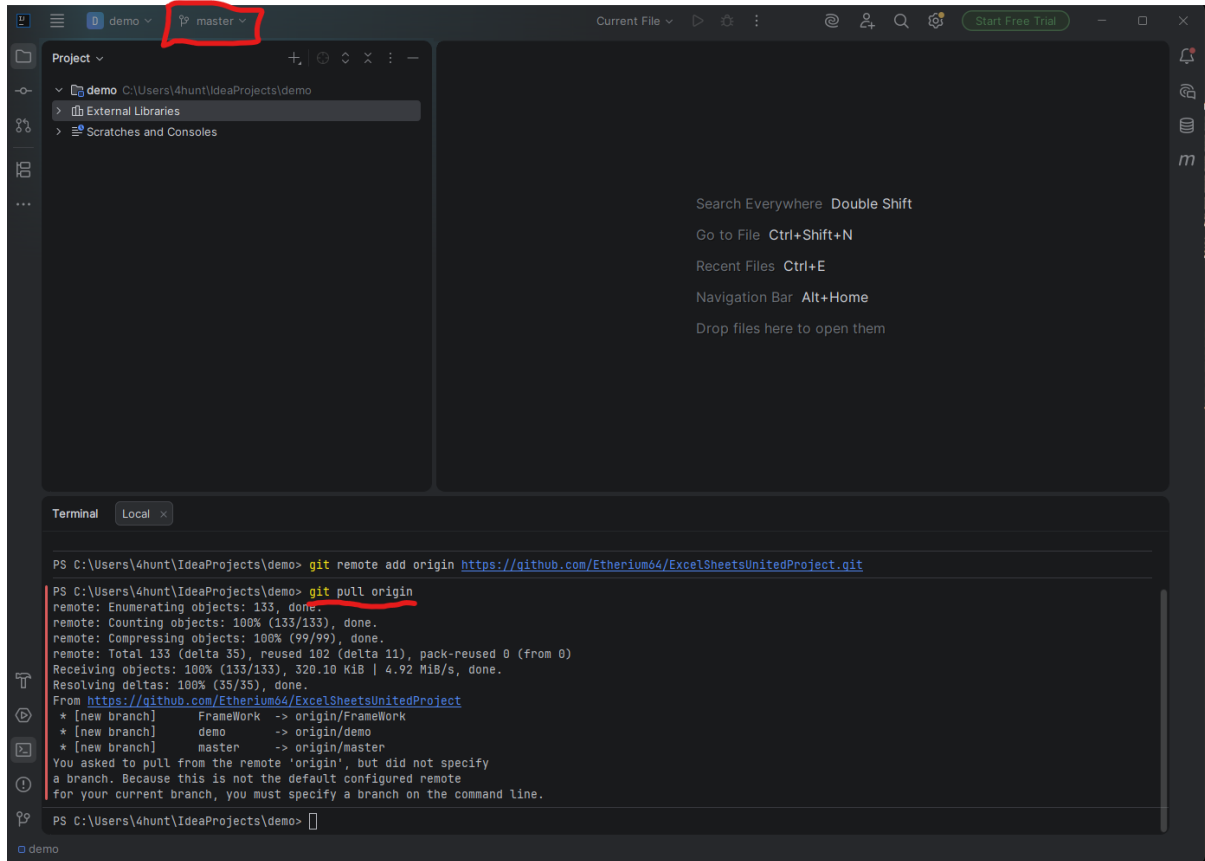

`git remote add origin https://github.com/Etherium64/ExcelSheetsUnitedProject.git`

Step 4:

Pull the repository and branches with:

`git pull origin`

Check the drop-down menu in the top left that says master, if done correctly, you'll scroll down and see local and remote with remote having all the current branches.

If that it all set up correctly you should be able to checkout into any branch and start working.

If its not give me a shout and I'll make time to trouble shoot it with you.

Notes for when pushing and pulling branches:

- When you are working on a branch before you commit and push it maybe drop a message in the chat to make sure no one is also currently working on the same branch.
- Before you push your updates to the repository make sure you have the most recent version of the branch your working in.
- In a separate file make sure you have a copy of all the stuff you did for security in case an issue comes up and we must roll back the branch causing all your work to be deleted.
